

AUTHORIZED: Fix Onboarding Data Pipeline Bugs 1 & 2

Status: PLEASE IMPLEMENT

What You're Fixing

Two data pipeline bugs where onboarding data is collected from the user but silently dropped before reaching the database. These are NOT new features — they are fixes to make existing UI actually work as intended.

Bug 1: Interests Not Saving to Database

The problem: Profile-setup Step 3 collects `selectedInterests` via the chip grid UI, but the `handleFinish()` function's PATCH payload does NOT include interests. The data is collected and then silently discarded.

The fix:

1. Add `selectedInterests` (as an array) to the PATCH body in `handleFinish()` :

TypeScript

```
body: JSON.stringify({
  homeCity: homeCity.trim() || null,
  isBusinessOwner,
  isContentCreator,
  isCommunityOrganizer,
  allowDm,
  showCity,
  culturalInterests: Array.from(selectedInterests), // ← ADD THIS
  profileSetupComplete: true,
}),
```

1. In the backend PATCH `/api/auth/user/setup` handler, save `culturalInterests` to `user_preferences.cultural_interests` (jsonb column — should already exist based on KinfolkAI's `buildSystemPrompt` reading it).
2. If `user_preferences.cultural_interests` column doesn't exist, create it as `jsonb DEFAULT '[]'::jsonb`.

Verification: After fix, create a test account, select 3 interests in profile-setup, complete setup, then query `user_preferences` for that user — `cultural_interests` should contain the 3 selected values.

Bug 2: Heritage Data Never Reaches Database

The problem: `identity.tsx` collects `diasporaCountries` and `designations` and stores them in AsyncStorage under `@mwm_pending_ownership_prefs`. After signup and profile-setup, this data is never retrieved from AsyncStorage and written to the database.

`user_preferences.diaspora_countries` starts empty for every new user. KinfolkAI reads this field but it's always `[]`.

The fix:

1. In `profile-setup.tsx` (or in the signup completion flow), retrieve the pending data from AsyncStorage:

TypeScript

```
const pendingPrefs = await AsyncStorage.getItem('@mwm_pending_ownership_prefs')
const parsed = pendingPrefs ? JSON.parse(pendingPrefs) : null;
```

1. Include it in the PATCH payload (or a separate POST to `/api/kinfolk/preferences`):

TypeScript

```
// Either add to the profile-setup PATCH:
diasporaCountries: parsed?.diasporaCountries || [],
preferredOwnershipTypes: parsed?.designations || [],

// OR call the existing preferences endpoint separately:
await fetch(`${base}/api/kinfolk/preferences`, {
  method: 'PATCH',
  headers: { 'Content-Type': 'application/json', Authorization: `Bearer ${token}` },
  body: JSON.stringify({
    diaspora_countries: parsed?.diasporaCountries || [],
    preferred_ownership_types: parsed?.designations || [],
  }),
});
```

1. After successful write, clear the AsyncStorage key:

TypeScript

```
await AsyncStorage.removeItem('@mwm_pending_ownership_prefs');
```

1. Ensure the backend handler for whichever endpoint you use actually writes to `user_preferences.diaspora_countries` and `user_preferences.preferred_ownership_types` .

Verification: After fix, go through the full flow (onboarding identity screen → select heritage + designations → create account → complete profile-setup) then query `user_preferences` for that user — `diaspora_countries` and `preferred_ownership_types` should contain the selected values.

What NOT to Touch

DO NOT build Bug 3 ("What brings you here?" step). This adds a new onboarding screen and is being held for post-Apple-approval. Do not create the screen, the DB column, or the Kinfolk first-message logic until explicitly authorized.

DO NOT change any existing UI. These fixes are backend data pipeline only — the user sees the exact same screens, same questions, same flow. The only difference is that their answers actually reach the database.

DO NOT change the onboarding screen order, copy, or design. No visual changes whatsoever.

Risk Assessment

Risk	Level	Mitigation
Apple review impact	NONE	No UI changes, no new screens, no new permissions
User-facing regression	NONE	Same screens, same flow — data just actually saves now
KinfolkAI behavior change	LOW/POSITIVE	Kinfolk will now have interests and heritage data to work with — recommendations improve

Data migration for existing users	LOW	Existing users who already completed onboarding have empty fields — they can update via KinfolkAI preferences later, or we can prompt re-entry in a future update
-----------------------------------	-----	---

Confirmation Required

After implementing, please confirm:

1. Show the updated PATCH payload from `handleFinish()` with interests included
2. Show the AsyncStorage retrieval code that transfers heritage to the database
3. Confirm both `user_preferences.cultural_interests` and `user_preferences.diaspora_countries` are populated for a test user who completes the full flow
4. Confirm no UI changes were made — screenshots of profile-setup should look identical before and after
