

Cross-Platform Parity — Non-Negotiable Principle

Status: LOCKED DECISION — PERMANENT REQUIREMENT

The Principle

ONE ACCOUNT. ONE EXPERIENCE. EVERY PLATFORM.

A user must be able to log in on the website, iOS, or Android and have the EXACT SAME experience. Every action taken on one platform must be reflected on all others. The website is NOT a marketing page — it IS the product. The mobile app is NOT a separate product — it's the same product on a different screen.

Think Facebook, Instagram, Twitter: You can post from your phone, comment from your laptop, and see notifications on your tablet. Everything syncs. Everything is the same product. That's the standard.

What This Means in Practice

Every Feature on Mobile MUST Exist on Web

Feature	Mobile	Web (Current)	Web (Required)
View business card	✓	✗ Limited	✓ Full card with all layers
Leave a review	✓	✗ Only "add comment"	✓ Full review with rating
"What stands out?" tags	✓	✗ Missing	✓ Same tag selection
Save a business	✓	✗ Missing	✓ Same save functionality
Share a business	✓	✗ Missing	✓ Same share options
Endorse ("Put your people on")	✓	✗ Missing	✓ Same endorsement flow

View community insights	✓	✗ Missing	✓ Same metrics display
Nominate as Hidden Gem	✓	✗ Missing	✓ Same nomination flow
Vibe Check / Add Vibe	✓	✗ Missing	✓ Same vibe system
Interactive map with pins	✓	✗ "Coming soon"	✓ Full interactive map
Search businesses by city	✓	✗ Returns 0 results	✓ Same search, same results
View profile with badges	✓	⚠ Shows blank	✓ Full profile with all data
KinfolkAI chat	✓	⚠ Widget only	✓ Full chat experience
Safety Hub	✓	✗ Missing	✓ Same safety features
Living Legacy	✓	✗ Missing	✓ Same city stories

Cross-Platform Sync (Non-Negotiable)

Action	Must Sync Across
Leave a review on web	Shows on mobile immediately
Save a business on mobile	Shows in "Saved Places" on web
Earn a badge on mobile	Shows on web profile
Update profile on web	Reflects on mobile
Endorse a business on mobile	Count updates on web
Complete onboarding on mobile	Web knows you're onboarded
Change privacy settings on web	Applies on mobile

This is not a "nice to have." This is how modern platforms work. If the data lives in the same database (Railway Postgres), there is NO technical reason for the web and mobile to show different things.

The Website's Role

What the website is NOT:

- ❌ A marketing brochure
- ❌ A "coming soon" placeholder
- ❌ A lesser version of the mobile app
- ❌ A waitlist-only page

What the website IS:

- ✅ The full MWM product, accessible from any browser
 - ✅ The first experience for people who scan the QR code on tour
 - ✅ The experience for people who don't want to download an app yet
 - ✅ The experience for people on desktop/laptop
 - ✅ Equal to mobile in every way
-

Why This Matters for the Tour

When someone scans your QR code in Charlotte on Aug 15:

1. They land on the website (not the App Store)
2. They see the waitlist → they join
3. They want to explore → they click "Explore" or "Map"
4. They should see Philadelphia's pins, Charlotte's cultural sites, the full experience
5. They think "wow, I need to download this" → they go to the App Store

If step 4 shows "coming soon" or "0 results" — they leave and never come back. The website IS the first impression for every tour attendee who hasn't downloaded the app yet.

Implementation Priority

Phase 1 (Build 103 — Before Tour):

- ☐ Fix the API so search returns results on web (same data as mobile)
- ☐ Interactive map with pins on web (Google Maps or Mapbox — same as mobile)
- ☐ Business card on web shows full description, visit_tip, cultural community

- ☐ Profile page shows real data (name, badges, saved places)
- ☐ Web and mobile use the SAME API endpoints (no separate web-only endpoints)

Phase 2 (Build 104-105):

- ☐ Full review system on web (not just "add comment")
- ☐ "What stands out?" tags on web
- ☐ Save/share/endorse on web
- ☐ Living Legacy pages on web
- ☐ Safety Hub on web

Phase 3 (Build 106+):

- ☐ Full feature parity — every mobile feature available on web
- ☐ Responsive design (works on phone browser, tablet, desktop)

Technical Requirement

The web and mobile apps MUST use the same API endpoints. If the mobile app calls `GET /api/businesses?city=Philadelphia`, the web app must call the SAME endpoint and get the SAME results. There should be ONE backend serving BOTH platforms. No separate "web API" and "mobile API."

If this is already the case (same backend), then the web frontend simply needs to be updated to call the same endpoints the mobile app uses and render the same data.

Verification

After implementation, the founder will:

1. Leave a review on the WEBSITE
2. Open the MOBILE APP
3. Verify the review appears on mobile
4. Save a business on MOBILE
5. Open the WEBSITE
6. Verify the saved business appears in "Saved Places" on web

If any of these fail, cross-platform parity is not achieved.

This Is a Locked Decision

This principle cannot be deferred, deprioritized, or treated as a "future feature." Every build from this point forward must maintain cross-platform parity. If a feature ships on mobile, it must ship on web in the same build or the immediately following build. The web is never more than one build behind mobile.

Add this to the Build Roadmap as a permanent constraint.
